

Advance Flow Case 1:

A user can take an advance amount even without submitting an application.

Case 2:

A user can take an advance amount against a case. For this, the following rules must be applied:

1. Calculate the total percentage based on the case.
2. The calculation will depend on the bank products (i.e., what Parker is offering on each product).
3. The percentage should be calculated only on the product, not based on the bank's MIS.
4. If the case gets rejected, Parker must convert that advance into a "No-Case Advance."

Case 3:

Add a new field "percentage" in the bank product list. This field will be used only for advance calculation at the time of advance creation.

Case 4:

Advance will be given only to the Channel Partner, not to their associates or any sub-associates.

Settlement Flow 1. Once the Maker updates the settlement details, the list will be sent to the Checker.

2. The Checker can view the settlement list and identify which cases are tagged as advances.
3. In the settlement list, the user can also view the remaining advance amount.
4. A "Make Payment" button will be available on the settlement list.
5. The Checker will select the bank account and share the settlement list with the Channel Partner.
6. After receiving approval from the Channel Partner, the Checker will mark the settlement as completed.
